

## Burn Pan™ - Challenge by the Chief Application Story #2

With the trend towards more environmentally friendly procedures, you have been charged, by the chief, with the task of finding other methods of conducting fire extinguisher training.

A barrel that is cut in half, lying on its side, filled partially with water, topped with diesel fuel, just does not cut it anymore. Getting rid of the unspent fuel in the barrel is the issue. For years, it was just dumped. Now this could be considered an environmental issue.

The Chief also wants a safer procedure, one that eliminates flare ups and that does not splash around when the office workers blast it with the dry chemical. Even if it might give them a better appreciation for the crazy things fires can do it's too unpredictable.

The clean, inexpensive, and safe solution you found is the Burn Pan™ by Halcyon Products, Inc.

Imagine rolling the all stainless steel unit off of your truck, wheeling it to where you'll do the training. Within minutes, you fill the pan with water just over the burn element. Next, you attach the supply hose to the clean burning propane tank that you got from a local source. After your students have received the proper instruction on the use of the dry chemical

extinguisher, they are ready for action. You light a flare at the end of the extension pole provided, placing it over the open lid of the pan while your partner, from your department, turns on the fuel source. In an instant, you have a completely controlled, environmentally compatible training fire with all the needed realism of a fire but the safety of a propane grill. And, the best part is when you are done, clean up is easy. There are no hazardous chemicals. All you need to do is empty the water through the drain in the bottom of the unit.

Your chief is happy with your decision.
